Pending Nucleic Acid and/or Pending Amino Acid database searches now generate two sets or results. These databases were split into to two parts to reduce the time needed to update the databases daily. The split freed up more machine time for processing searches.

Searches run against the Nucleic Acid Pending database produce two sets of results, with the extensions, .rnpm and .rnpn

Searches run against the Amino Acid Pending database produce two sets of results, with the extensions, .rapm and .rapn

The Pending database search results should not be left in the case because they contain data that is confidential.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NAME/KEY: SEQ ID. NO:8 is the sequence
NAME/KEY: in claim 1(vi) starting at triplet in position 201-203
NAME/KEY: and ending at the triplet 3018-3020
LOCATION: not available seperiment.
IDENTIFICATION METHOD: experiment.
IDENTIFICATION METHOD: in specification
OTHER INFORMATION: prevention of IFN- induced
OTHER INFORMATION: programmed cell death

Patent No. 6160106

GENERAL INFORMATION:
APPLICANT: Yeda Research and Development Co. LTD

TITLE OF INVENTION: Tumor Suppressor Genes, Proteins
FILE REFERENCE: sequencelist
CURRENT APPLICATION NUMBER: US/08/810,712G

CURRENT FILING DATE: 1997-03-03

EARLIER APPLICATION NUMBER: PCT/US94/11598

EARLIER PRING DATE: 1994-10-12

NUMBER OF EQ ID NOS: 31

SOFTWARE: PatentIn Ver. 2.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score 50.8; DB 4;

sequence 25, Application US/09248335

patent No. 6096504

GENERAL INFORMATION:

APPLICANT: O'KEEF, DANIEL

ITLE OF INVENITON: PLANT GLUTATHIONE-S-TRANSFERASE ENZYMES

TITLE OF INVENITON: PLANT GLUTATHIONE-S-TRANSFERASE ENZYMES

FILE REFERENCE: CL-1128-A

CURRENT PILING DATE: 1999-02-10

SEALIER APPLICATION NUMBER: 08/924 759

BARLIER APPLICATION NUMBER: 1997-September-05

NUMBER OF SEQ ID NOS: 74

SEQ ID NO 25

LENGRIH: 1279
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match 3.4%; Score 48.4; DB 1; Length 1898; Best Local Similarity 68.4%; Pred. MAXWell S.A., Davis G.E.;

"Differential gene expression during capillary morphogenesis in 3D collagen matrices: regulated expression of genes involved in basement membrane matrix assembly, cell cycle progression, cellular differentiation and G-protein signaling.",

J. Cell Sci. 114:2755-2773(2001).

SUBUNIT: Seems to bind to collagen type IV and laminin.

SUBCELLULAR LOCATION: Type I membrane protein (Probable).

SUMILARITY: BELONGS TO THE ATR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    183 FNETQLARIADSKDHVFPVNDGFQALQGIIHSILKKSCIEILAAEPSTICAGESFQVVVR 242

1ISSUES CONTAINING TYPE I COLLAGEN.
1 SEQUENCE DEFINES FIVE DISTINCT DOMAINS, TWO TRIPLE-
1 DOMAINS (NCL, NC2, AND NC3).
1 PTW. THE TRIPLE-HELICAL TAIL IS STABILIZED BY DISULFIDE BONDS AT
1 EACH END.
1 PTW. THE TRIPLE-HELICAL TAIL IS STABILIZED BY DISULFIDE BONDS AT
1 GACH END.
2 INTERPREPARED, CHONDROITIN-SULFATED (BY SIMILARITY).
3 SINILARITY: EBLONGS TO THE FIBRIL-ASSOCIATED COLLAGENS WITH
3 SIMILARITY: CONTAINS 4 WWFA DOMAINS.
3 SIMILARITY: CONTAINS 18 FIBRONECTIN TYPE III-LIKE DOMAINS.
3 SIMILARITY: CONTAINS 18 FIBRONECTIN TYPE III-LIKE DOMAINS.
FORM OF COLLAGEN XII MAY CONTAIN HOMOTRIMERS OF EITHER THE LONGER OR THE SHORTER ISOFORM OR ANY COMBINATION OF LONG AND SHORT ISOFORM CHAINS. ONLY THE LONG VARIANT IS A PROTEOGLYCAN. THE LARGE ISOFORM HAS MORE RESTRICTED EXPRESSION IN EMBRYONIC TISSUE THAN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   natrix; Connective tissue; Repeat; Hydroxylation; Collagen; Signal; Glycoprotein; Alternative splicing. 24 POTENTIAL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              COLLAGEN ALPHA 1(XII) CHAIN. DISEASE: DEFECTS IN WAS ARE THE CAUSE OF WISKOTT-ALDRICH SYNDROME DISEASE: AN X-LINKED RECESSIVE IMMUNOBETICIENCY CHARACTERIZED BY ECZEMA, THROMBOCYTOPENIA, RECURRENT INFECTIONS, AND BLOODY ECZEMA, THROMBOCYTOPENIA, RECHRS BEFORE AGE 10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -i- FUNCTION: POSSIBLE REGULATOR OF LYMPHOCYTE AND PLATELET FUNCTION.
MAY BE INVOLYED IN SIGNALING PATHWAYS WITH CYTOSKELETAL FUNCTION.
-i- SUBUNIT: BINDS TO CDC42, RAC, NCK, FYN, SRC KINASE FGR, BTK, ABL,
WIP, AND TO THE P85 SUBUNIT OF PLC-GAMMA.
-i- TISSUE SPECIFICITY: EXPRESSED PREDOMINANTLY IN THE THYMUS. ALSO
FOUND, TO A MUCH LESSER EXTENT, IN THE SPLEEN.
-i- DOMAIN: THE WHI (WASP HOMOLOGY 1) DOMAIN MAY BIND A PRO-RICH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MEDLINE-88378988; PubMed-9713366; Rachard B.D., Giliani S., Faccheti F., Blanzuoli L., Vermi W., Notarangelo L.D., Giliani S., Frorini M., Fasth A., Stewart D.M., Nelson D.L.; "Defective actin polymerization in EBV-transformed B-cell lines from patients with the Wiskott Aldrich syndrome.";

Essential for maintenance of normal retinal and cochlear function.
SUBCELLUIAR LOCATION: Type I membrane protein (By similarity).
TISSUE SPECIFICITY: Expressed in brain, lung, kidney, spleen and restis. Found also in the inner and outer synaptic layers, and the nerve fiber layer in adult and fetal retinas. Found in the supporting cells, outer sulcus cells and spiral ganglion of fetal
                                                                                                                                                                                                                                                                                                                                                                                                                     TISSUE-Fetal brain;

"Mutations in the novel protocadherin PCDH15 cause Usher syndrome type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DISEASE: Defects in PCDH15 are the cause of Usher syndrome type 1F (USH1P). Usher syndrome type 1 is a autosomal recessive disorder characterized by congenital profound sensorineural hearing loss. constant vestibular dysfunction and prepubertal onset of retinitis spignentosa leading to blindness. Usher syndrome is the most common cause of combined deafness and blindness in developed countries. SIMILARITY: CONTAINS IL CADHERIN DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PubMed=11398101;
